Introduction

This product is a high-performance micro-stepping driver.

Smooth driver

By using micro-stepping, this driver can achieved low-vibration and low-noise.

Built-in overheat protection

A driver's internal temperature in excess of 70°C (158°F) trigger overheat protection, and the driver will stop working automatically.

Adjustable operating current

A digital switch adjusts the level of motor current during operation.

Bio-polar drive

By using bio-polar drive, this driver is powerful than uni-polar driver and only needs four wires connected to the stepping motor.

Automatic reduce current

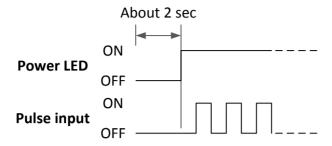

In the stop state, the driver will reduce the current automatically to limit the heat generated by the motor and driver.

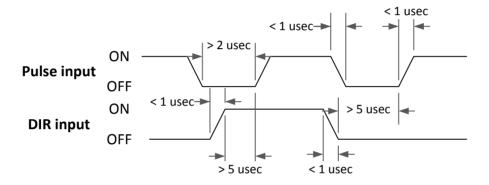

Specifications

	Min	Typical	Max
Supply Voltage (VDC)	20	24	40
Output Current (A _{peak})	0.64		2.12
Logical Input Current (mA)	7	10	16
Input Frequency (KHz)	0	-	200
Low-Active Required Time(us)	2.5	-	-

0	Ambient temperature	0 to +65°C (+32 to +149°F) (non-freezing)	
Operation Environment	Humidity	80% or less (non-condensing)	
Environment	Surrounding atmosphere	No corrosive gas, dust, water or oil	
Chaman	Ambient temperature	-10 to +80°C (+14 to +176°F) (non-freezing)	
Storage Environment	Humidity	80% or less (non-condensing)	
Environment	Surrounding atmosphere	No corrosive gas, dust, water or oil	
Vibration	5.9 m/s ² or less		
Mass	0.15 Kg		

• Timing chart

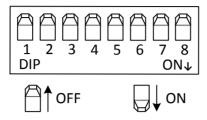

Setting

By switching the following DIP-SWITCH, user can change the output current and micro-steps of driver.

Current Set

SW 1	SW 2	SW 3	Current (A _{rms})
ON	ON	ON	0.64 A
OFF	ON	ON	0.85 A
ON	OFF	ON	1.06 A
OFF	OFF	ON	1.27 A
ON	ON	OFF	1.49 A
OFF	ON	OFF	1.70 A
ON	OFF	OFF	1.91 A
OFF	OFF	OFF	2.12 A

• Reduce Current Function

SW 4	Function	
ON	Maintain full current in the stop state	
OFF	Automatically reduce current in the stop state	

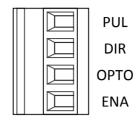

• Micro-Steps (for 1.8° basic step)

Connection

Control signal

This terminal is used for control signal.

This driver only accepts pulse/dir type signal (1-pulse input type).

PUL	Pulse signal input	Motor will run one micro-step when driver receive one pulse. RiseSide-Active, the internal resistor is $270\Omega \circ Logical$ low is $0 \sim 0.5V$; Logical high is $4 \sim 5V$. Signal width must be larger than 2.5 usec.
DIR	Direction signal input	Decide the rotational direction. The internal resistor is 270Ω $^{\circ}$ Logical low is 0 $^{\sim}$ 0.5V; Logical high is 4 $^{\sim}$ 5V. Signal width must be larger than 2.5 usec.
ОРТО	Photo-couple Positive	-
ENA	Free signal input	When this input be actived (Low-Active), the driver will shut off the output current and the motor will lose its excitation holding torque. This, however, will allow you to adjust the load position manually. Low-Active, the internal resistor is $270\Omega \circ Logical low$ is $0 \sim 0.5V$; Logical high is $4 \sim 5V$. Signal width must be larger than 2.5 usec.

NOTE

For control signal input, 5 VDC can be directly connected and applied. If signals are used at a voltage above 5 VDC, be sure to connect an external resistor to prevent the current from exceeding 16 mA. Applying a voltage beyond 5 VDC without using an external resistor will damage the internal elements.

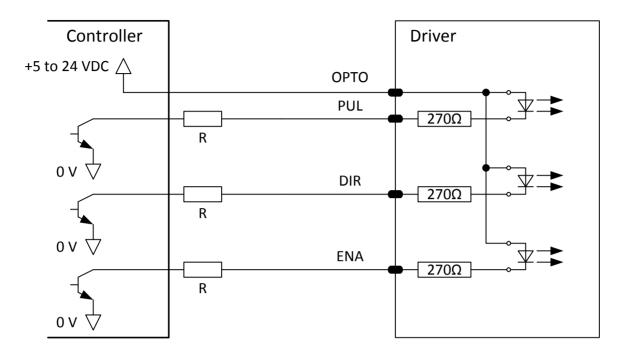

R=0, when using 5 VDC;

Example:

R=1k and > 1/8W, when using 12 VDC;

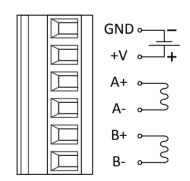

R=2k and > 1/8W, when using 24VDC.

▼ Example of connection with a current sink output circuit

Power supply and Stepping-Motor connect

This terminal is used for supply the motor and driver power. *Be careful not to touch the live connections.*

GND	Power Input Negative	The input power must be between 18VDC	
+V	Power Input Positive	to 40VDC.	
A+	Motor Phase A+		
A-	Motor Phase A-	Connect the motor wires as defined.	
B+	Motor Phase B+		
B-	Motor Phase B+		

Troubleshooting

When the motor cannot be operated correctly, refer to the contents provided in this section and take appropriate action. If the problem persists, contact your nearest office.

Phenomenon	Possible cause	Remedial action
The motor is not excited.	Bad connection of the motor cable.	Recheck the connections between the motor and driver. Take appropriate action and turn on the power again
The motor's output shaft can be turned easily with the hands. (The motor	Incorrect setting of the current-adjustment switch.	Check the rated current of motor and set the switch to rated current of motor.
equipped with an electromagnetic brake can be turned easily with the hands, once the brake is released.)	ENA input is active.	Dis-active the ENA signal.
	Overheat protection is active.	Shut off the driver's power and check the cause of the problem that had triggered overheat protection. Take appropriate action and turn on the power again
